

# GAUGE COCKS

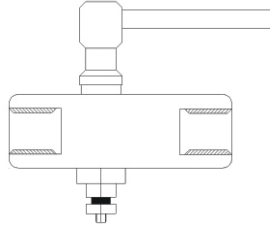

Gauge Cocks isolate a pressure gauge from the medium in order to enable inspection or replacement of the pressure gauge and also to extend the operating life of gauge where pressure is continuously pulsating.

In the OFF position, the pressure medium is blocked and the gauge system can be opened to the atmosphere. In the ON position, the gauge is open to the pressure medium.

Constructed from barstock in 316L stainless steel or brass, with bubble-tight shut-off for process situations up to 24bar (400PSI), PCI's gauge cocks are also available with a venting port by which the pressure can be released into the atmosphere.
